LIST Entry List Model

Overview

The List Entry List model returns the list stored in a LIST catalog entry.

Ancestors:

sashelp.fsp.Object.class
sashelp.fsp.Selmdl.class

Class:

sashelp.classes.Listentrylist_c.class

Using the LIST Entry List Model

You can use the LIST Entry List Model class in conjunction with a viewer control for model/view communication. When you drop a model on a control in a frame, or you set the control’s model attribute to the name of the instantiated model object, the items attribute of the view is automatically set to the items attribute of the model.

For example, add a list box control and a catalog entry list model to a frame, then set listbox1.model to listentrylist1. To display the list contained in the LIST entry in the listbox, specify a value for listentrylist1.entryName.

You can also use the model in an SCL program to retrieve a list from a specified LIST entry. Once you specify a valid LIST entry for the object’s entryName attribute, simply query the items attribute to get the list of catalog entries.

Attributes

Public attributes specified for the LIST Entry List Model class are described here. See sashelp.fsp.Selmdl.class for inherited attributes.
Dictionary

description

Returns the short description for the object
Type: Character
Valid Values:

entryName

Returns or sets the LIST entry name used to build the items list
Type: Character
Valid Values:
Editor: sashelp.fsp.listdlg.scl

Methods

Methods specified for the LIST Entry List Model class are described here. See sashelp.fsp.Selmdl.class for inherited methods.

_bterm

Terminates an object at design time

Syntax

objectName_bterm( );
**_init_**

Initializes an object

**Syntax**

objectName_init( numArg );

objectName_init( );

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Use</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numArg</td>
<td>Numeric</td>
<td>Update</td>
<td>specifies a numeric argument that can be the identifier of an SCL list if you wish to pass several values to the _init method. If you create an object with a _new method or the INSTANCE function, num</td>
</tr>
</tbody>
</table>

**_term_**

Deletes an object

**Syntax**

objectName_term( );

**Events**

Events specified for the LIST Entry List Model class are described here. See sashelp.fsp.Selmdl.class for inherited events.

entryName changed

Occurs when the entryName attribute is changed
